Hi Andrea,

Happy New Year! Thanks for the update on the press release. I think your plan makes sense.

When you know a little more definitively about when you plan to send out the release, please let me know so I can make sure our web pages will be updated.

In the meantime, I'll draft a CDC quote and will run it by our folks. I should be able to turn it around in the next couple of days if that works for your timeline. And I'll also gather up the names of a few reporters who may be interested in seeing the information.

More to come....

Brian

Hi Brian,

I hope you had a great holiday. We're working our way toward announcing our C. Auris registrations in the next few weeks. We are targeting the week of the 13<sup>th</sup> as of now, but can be flexible based on the timing of your web updates, as we had discussed. I'm attaching our draft press release, which is still going through review here at EPA (especially since I just made another round of tweaks that my folks are seeing for the first time in this draft!!), but I wanted to get the draft to you so that you could start thinking about/working on a quote from your end.

As far as press is concerned, we will be doing a national release. I'm also hoping to have our regional offices push the release out to their local lists and pitch some local reporters who have covered the issue over the past year.

Hi Andrea,

Hope you had a nice (and flu-free) weekend. I checked in with our *C. auris* program folks and they said they'll likely update the list of approved disinfectants in early to mid-January. They're a little hesitant to hold it because this is "information facilities are using to guide infection control and we want to make it available to them as quickly as possible."

# Ex. 5 Deliberative Process (DP)

Let me know if you want to discuss further.

Thanks!

Brian

Good morning Carol Ann,

I am not sure if the article was sent to you though the Washington Post, but here is a copy of the requested article.

## The superbug threat is morphing

A new CDC report shows that it is worsening in some ways.

- The Washington Post
- 28 Nov 2019

THE CENTERS for Disease Control and Prevention has published a disturbing new report on antibiotic resistance, the first since its benchmark survey in 2013. Antibiotic resistance is the tendency of pathogens — bacteria and fungi — to fight back against antibiotic drugs, making some infections harder to treat, or untreatable altogether, one of the most severe public health threats in the world today. The CDC'S report offers a glimmer of hope that resistance can be slowed, but it also shows how the dangers are deepening and changing, including with a new pathogen that wasn't even on the radar screen six years ago.

Antibiotics, the miracle drugs invented in the mid-20th century, have made possible a revolution in modern medicine — for example, enabling organ transplants — and have spared countless individuals from death and illness. When bacteria became resistant in the early years, new antibiotics were readily created. But more recently, the pipeline of antibiotic development has slowed, and patients are again confronting untreatable illnesses.

The CDC knew this when it estimated in 2013 that 2 million Americans had suffered antibiotic-resistant infections resulting in 23,000 deaths a year. But using improved data methods, the CDC has now revised the estimates to 2.6 million infections then, and 44,000 deaths, nearly twice as many as thought. Today, the agency says there are 2.8 million infections and 35,000 deaths a year. The number of deaths due to antibiotic-resistant infections has dropped by 18 percent, according to the CDC, largely because of successful interventions by hospitals. That's the good news.

But there is plenty to worry about. Though hospitals are making headway, the agency found some of the greatest increases in infections are acquired outside hospitals. Also, the threat of antibiotic resistance is remarkably fluid; new threats arise even as old ones are mitigated. For example, the CDC has raised the alert level to "urgent" for *Candida auris*, a multi-drug-resistant yeast that can cause invasive infection and death. Some strains are resistant to all three available classes of antibiotics. It wasn't even listed in the 2013 report, but the CDC says reported cases have surged 318 percent in 2018 compared with 2015 to 2017. The CDC has also raised the alert level to "urgent" for strains of *Acinetobacter* that are resistant to carbapenems, a class of highly effective antibiotics. Also concerning: Gonorrhea, a sexually transmitted disease, has rapidly become resistant to all but one class of antibiotics.

The CDC has put a welcome and needed emphasis on fighting antibiotic resistance as a "one health" problem that is interconnected between human and animal health, and the environment. Big challenges remain, including being vigilant against overuse of antibiotics and creating an improved model for developing new antibiotics. There is no excuse for inaction. The threats are real, dynamic and persistent.

Thanks,  
Jennifer
